

SMART MANAGED SECURITY.

AFFORDABLE NETWORK SECURITY AS A SERVICE.

Comprehensive managed security, designed to support lean IT teams and get them back to their other projects.

Up your network's protection and performance.

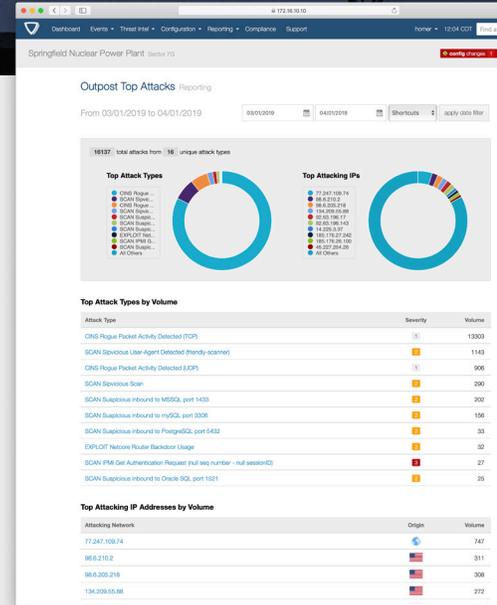

- Shield the network edge by disrupting attacker reconnaissance, blocking inbound exploitation attempts, and stopping outbound beaming malware in its tracks.
- Reduce the firewall's workload by up to 70% and enhance visibility into exploits, scans, and other malicious traffic.
- Identify weaknesses and misconfigurations on the firewall and external network.

Gain internal visibility.

- Detect beaming malware and ransomware, phishing scams, and other malicious infections as they happen.
- Locate problem devices quickly, and identify and monitor unique and interesting internal traffic.
- Find outdated systems, identify network misconfigurations, and locate critical system vulnerabilities across the LAN.

Take back your time.

- Take advantage of our hybrid Managed Detection and Response team for support, troubleshooting, and research.
- Receive real-time alerts for critical security events and network issues, and get support 24/7.
- Manage your devices, critical alerts, vulnerability scan results, and support through Sentinel HQ.

Sentinel Outpost

- Enterprise Intrusion Prevention and Threat Intelligence Gateway
- Automated alerts and 24/7 support for critical events and troubleshooting
- 1Gbps / 10Gbps / Copper / Fiber / DAC / Fail-to-wire configurations

“TRULY GREAT.”

“The Sentinel products are an invaluable addition to our layered security model. They provide a solid product with great value and amazing support. The fully managed system provides exceptional protection and minimal “noise” allowing us to focus resources on other layers. Sentinel has far exceeded not only our previous vendor, but our own expectations as well.”

Network Administrator, a regional bank in Michigan

WHAT SETS US APART?

A unique take on the industry's most effective enterprise network security strategies, distilled down to a simple solution, and backed by security experts always there to support you.

MAKE YOUR NETWORK INVISIBLE TO THE BAD GUYS. NETWORK CLOAKING™

Traditional inline security tools spot malicious packets and send an alert. They might drop a few malicious packets, but these bad actors remain free to scan your network, probing for additional attack vectors. **We take a different approach with a proprietary methodology we call Network Cloaking.** Instead of blocking a few packets, we drop all communication to and from malicious networks. Your network becomes completely invisible to the bad guys, as if you never existed at all. You stay safe, and they move on to other targets. One less bad guy to worry about.

MUCH MORE THAN JUST A BLACK BOX. HYBRID MANAGED DETECTION AND RESPONSE

Our Sentinel Hybrid MDR solution ensures your network is actively monitored by autonomous systems, backed by real human beings 24/7. **If there's a problem, you get an alert. If there's a network issue, we're troubleshooting. If there's a new threat brewing, we're already on it.** And whether there are actionable events or false positives to work through, we're there to assess the situation, offer our 20 years of expertise, and point you in the right direction. That saves you time and lets you get back to work.

THE COLLECTIVE BRAIN POWER TO STAY AHEAD OF THE LATEST THREATS. CINS ACTIVE THREAT INTELLIGENCE GATEWAY

Stay out in front of threats before they come knocking at your network door with Collective Intelligence Network Security (CINS). Our managed Threat Intelligence Gateway continuously gathers attack data from Sentinel devices around the world, as well as reputable InfoSec sources. Each Sentinel device is continuously updated with this new CINS threat intelligence and **dynamically blocks this malicious traffic before it reaches your critical infrastructure.**
